

ABSTRACT

The present invention provides a system and method for converting application specific presentation file stored with corresponding metadata to a universal format for display on a web browser without downloading of software to the client devices. The method includes the following steps: uploading the application specific file, detecting the uploaded application specific file, reading the metadata, determining from the metadata whether the file extension corresponds to the specific application, loading the file, validating that the file corresponds to the specific application by examining header information, converting the application specific file into a universal image file format, modifying the file, validating the resolution of the file, storing the file for display on the web browser, and transmitting the file to the web browser for display.
